

POM-H

POLYACETAL HOMOPOLYMER

Material description

POM - H is a highly crystalline thermoplastic which has a higher creep resistance, tensile strength, hardness, stiffness and abrasion resistance than POM - C. However, POM - H is less resistant to hydrolysis and has lower chemical resistance. POM - H should not be used in environments with hot steam or boiling water.

These technical data have been determined as average values by our suppliers from many individual measurements. In all measurements, the test specimens were tested in the dry state. We pass on the data with reservation. The table does not claim to be complete or correct. Material technology is subject to constant further development. No rights or guarantees can be derived from it. Own tests are necessary because the environmental and operating conditions (humidity, temperature, mechanical forces, radiation and chemicals, etc.) set limits in the application.
